

Loading in data

loading in your dataset is the first step...

It requires 1. A function
2. A file path

FUNCTIONS

`read.csv()`

BASE R

`read_csv()`

FROM LIBRARY readr

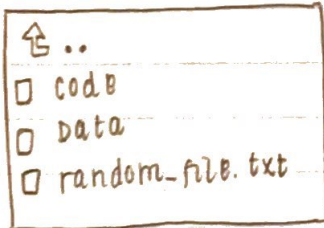

These 2 functions can both be used for the same purpose.

* BUT in this class, we favor this version!

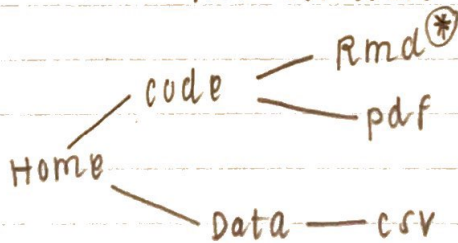

WHAT GOES (HERE)?

FILE PATHS, AKA WHERE YOUR DATA IS LOCATED

In Rstudio, take a look at 'Files'! You will see 2 folders. One is called 'code' and the other is 'Data'.

Your file structure looks like this normally.

The * is your starting point. In order to read your csv, you need to tell R where to find it.

THIS IS YOUR FILE PATH

" .. / Data / your_dataset.csv "

Dot dot tells R to go 1 folder up (from CODE → HOME)

From there, state the 'Data' folder

The name of your csv spreadsheet file
